Find Temperatures in Areas that Contain the Propellant  
During the Welding Process

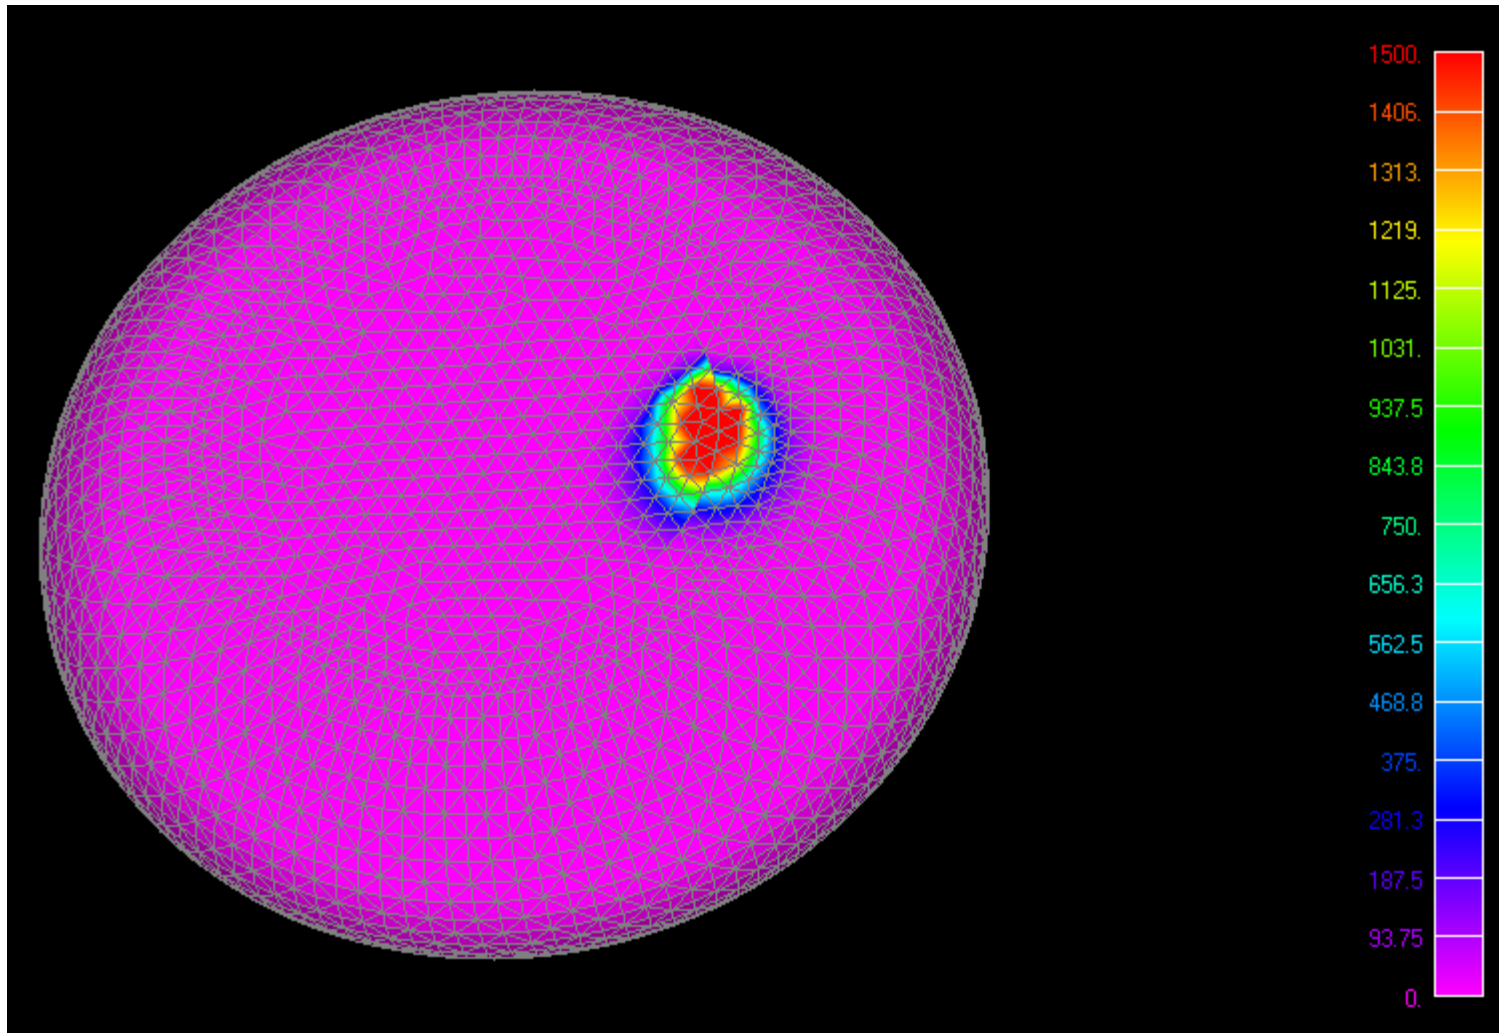

# Apply Weld Heat to Nodes on Edge of Cap

# Turn On Conductors Between Cap and Bottle as Weld Progresses

# Movie Snapshots

With SINDA/G much of the complex physics of the weld process can be modeled.

- Weld heat applied to moving weld area
- Thermal connection between parts as the weld progresses
- Temperature dependent conductivity and capacitance
- Phase change – liquid/solid and solid state
- Addition of weld material
- Radiation
- Forced and Natural Convection
- Thermally induced stresses and deformations can then be analyzed using the transient temperature results.
